

6 JEV PROJECTS

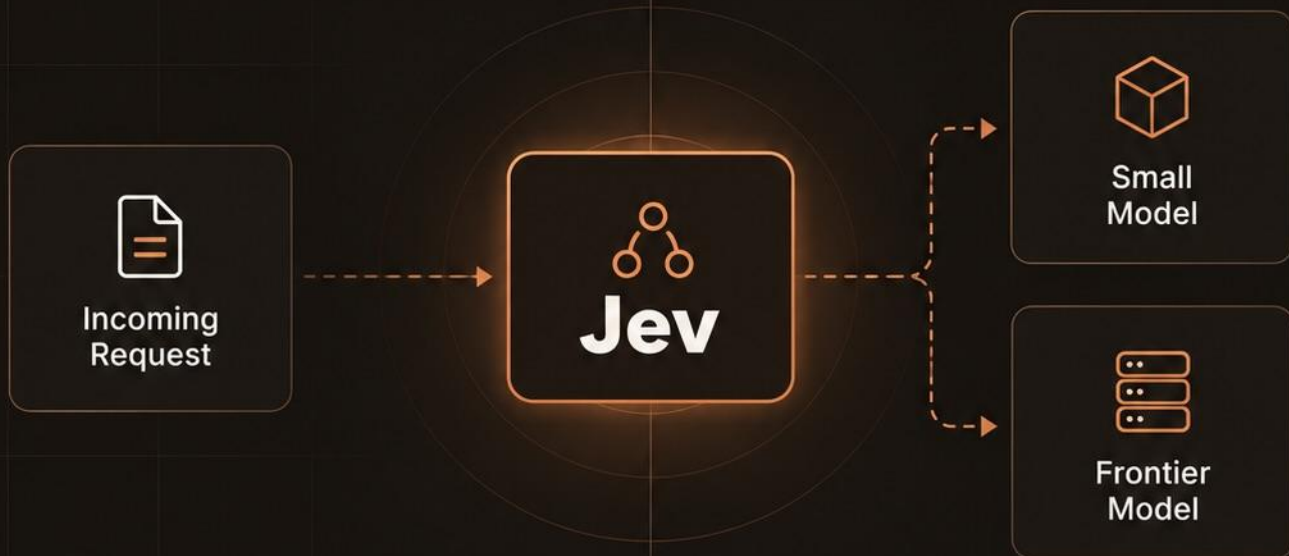

Build smarter AI systems

IDEAS
TOOLS
SYSTEMS
BETTER

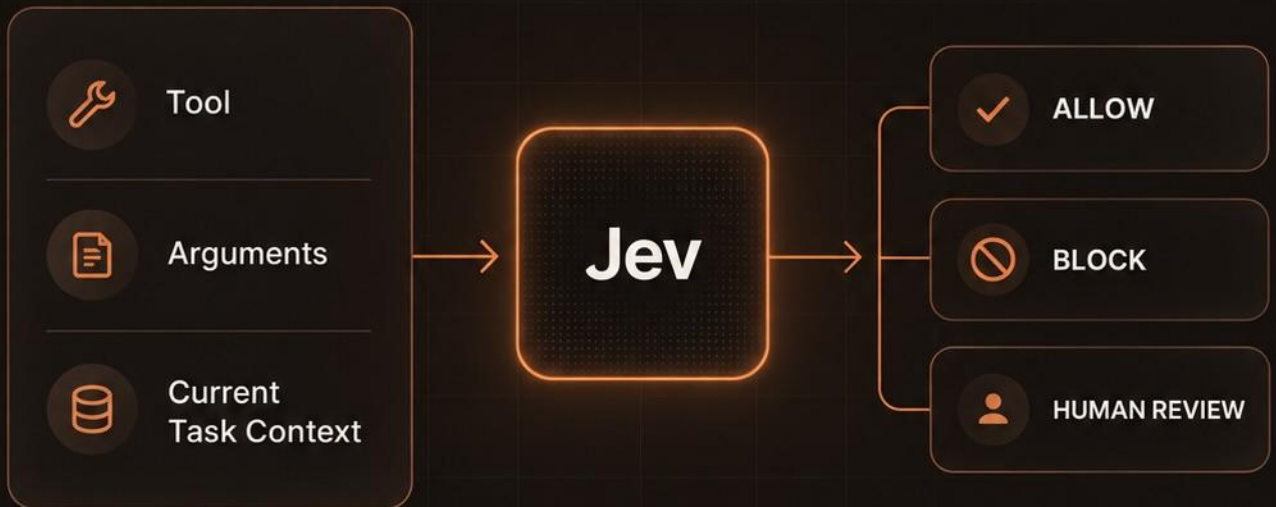

MODEL ROUTING

Jev takes the incoming request and predicts which model should handle it based on task complexity.

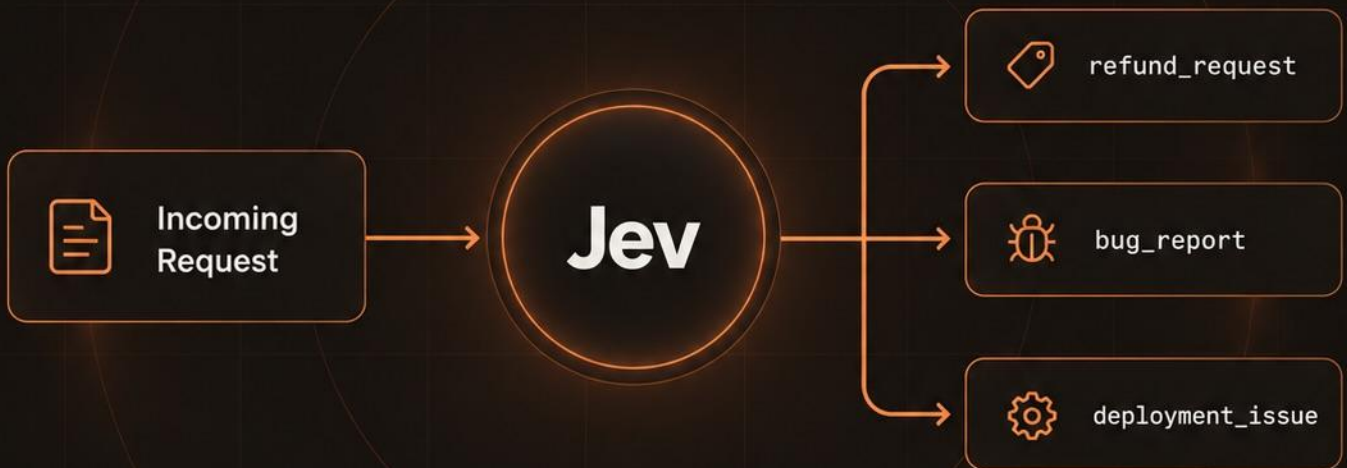

TOOL-CALL RISK GATES

Before an agent executes a tool, Jev scores the tool + arguments + current task context and returns a decision.

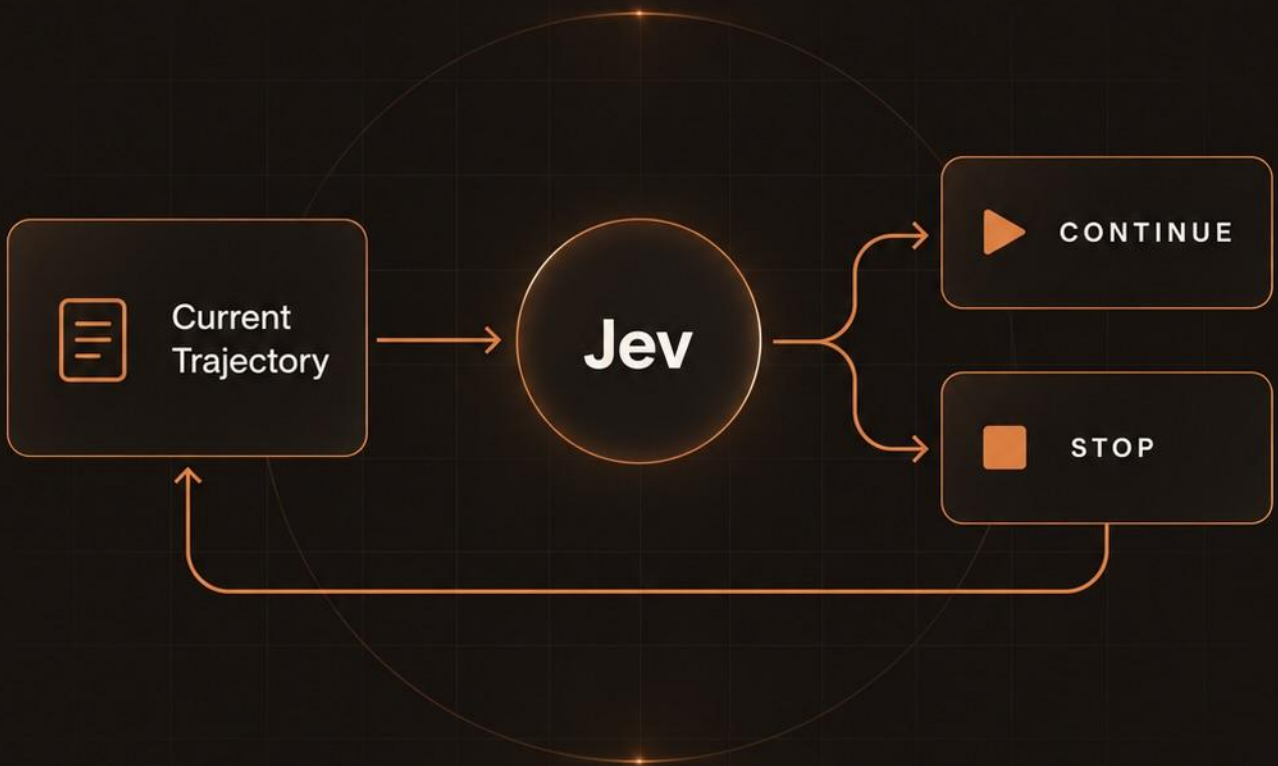

INTENT + DOMAIN TRIAGE

Jev classifies the request into a fixed set of intents before the main agent starts reasoning.

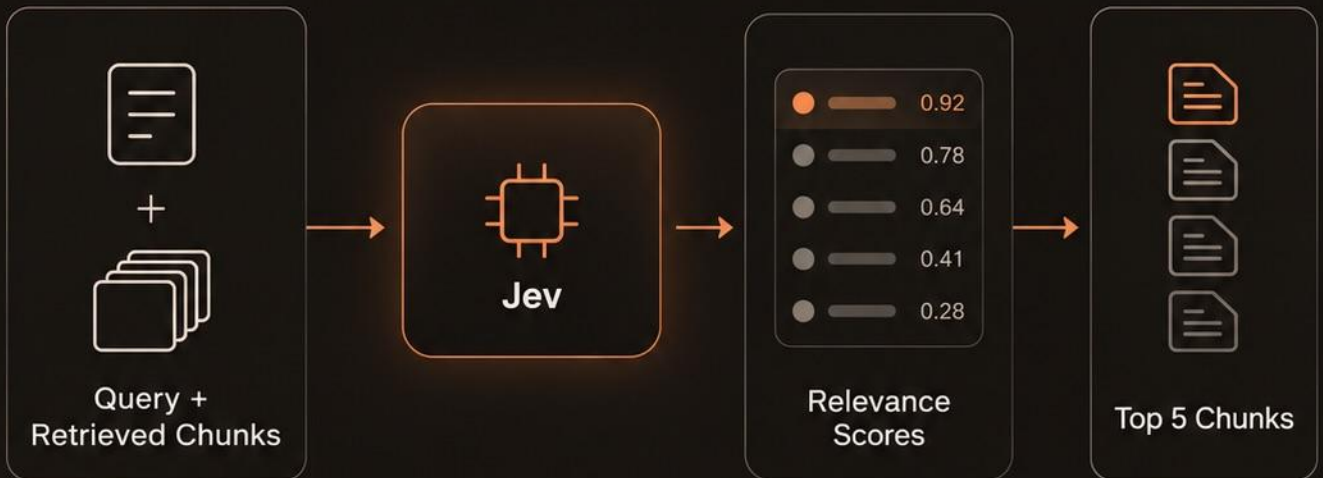

LOOP DECISIONS

After every agent step, Jev evaluates the current trajectory and predicts whether another step is likely to be useful.

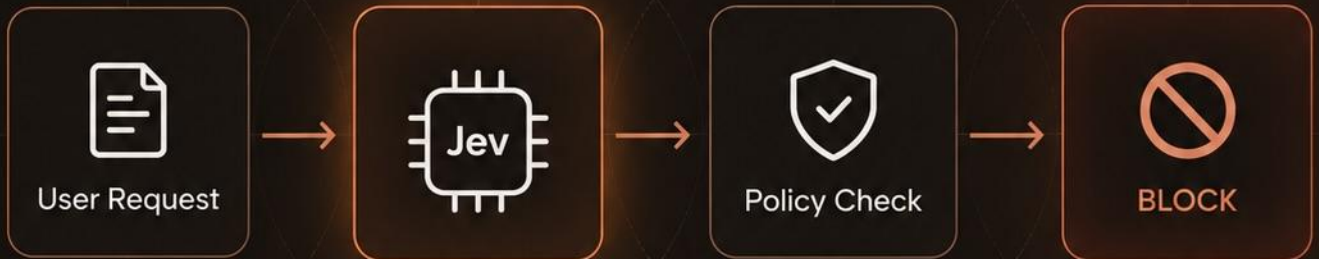

RAG RERANKING

Jev receives (query, retrieved_chunk) pairs and assigns a relevance score to each chunk.

GUARDRAILS & POLICY CHECKS

Jev turns safety checks into fast classification decisions instead of generating a full reasoning response.
