App interaction quality under latency, errors, and different inputs

Strengths and best use

The repeated 20-item checklist provides a practical way to review loading, navigation and recovery. Start with a task the user can complete. Use labeled navigation and visible feedback to make success, errors and recovery clear before adding decorative motion.

Test feedback and server behavior

Match skeletons to the final layout and verify that slow, empty and failed requests provide a useful next step. For optimistic changes, test rejection, rollback and retries. Pair a pending action with backend idempotency when replay can duplicate a mutation. A button spinner alone cannot enforce that behavior. Stripe idempotent requests (https://docs.stripe.com/api/idempotent_requests)

Test navigation, motion, and accessibility

Use direct navigation for common tasks, then provide keyboard shortcuts or a command menu as enhancements. Ensure mobile sheets can be dismissed by an obvious control and with the expected keyboard behavior. Check target size and contrast with the relevant WCAG criteria. Keep essential information available with reduced motion and a fallback for view transitions. Predictive back is Android-specific. WCAG target size (https://www.w3.org/WAI/WCAG22/Understanding/target-size-minimum.html) - View Transition API (https://developer.mozilla.org/en-US/docs/Web/API/View_Transition_API) - Android predictive back (https://developer.android.com/guide/navigation/custom-back/predictive-back-gesture)

Project idea

Audit one settings flow on desktop and touch. Record loading, success, rejection, retry, interruption and undo. Check focus visibility, safe areas, one-time-code autofill where applicable and readable numbers. Try BlurHash on an image-heavy screen. Measure transfer and latency before introducing prerendering or prefetching. BlurHash (https://github.com/woltapp/blurhash)

Reusable prompt

```
Test this flow with a keyboard, touch, delayed data and reduced motion. Specify expected feedback and retry behavior. For each change, record the prior behavior and the observable result.
```
