Code-driven video effects and motion toolkits

Strengths and best use

The reels offer a palette of title, typography, transition and illustration effects plus concrete repositories for prototyping them. Start with one scene whose timing and legibility you can verify frame by frame.

Match the tool to the intended artifact

- Bang Motion (https://github.com/bangtutorial/bang-motion) produces a browser-playable HTML scene. Its optional MP4 path documents Node, Puppeteer and FFmpeg.
- The charlie947 motion graphics pack (https://github.com/charlie947/motion-graphics-skills) includes a Vox-style explainer and a HyperFrames (https://github.com/heygen-com/hyperframes) export path. The CK42BB Vox skill (https://github.com/CK42BB/vox-explainer-skill) uses Atlas Cloud services. The reel's gated repository identity remains unresolved.
- Huashu Art Motion (https://github.com/alchaincyf/huashu-art-motion) provides parameterized animated illustrations and documents uv, FFmpeg and Chromium. Claude Drawing Skill (https://github.com/cloveric/claude-drawing-skill) uses NumPy and Pillow on CPU and now documents draw-on GIFs.

Review the files, licenses and dependency choices before enabling a skill. The maintainers document these setup commands for the relevant routes.

```
npx skills add charlie947/motion-graphics-skills
npx skills add heygen-com/hyperframes
npx skills add alchaincyf/huashu-art-motion
```

Project idea

Create a six-second title scene, then parameterize the text, duration, easing and output dimensions. Check the first, middle and final frames at phone size. Render twice from the same inputs, compare timing and layout, and record codec, render time and asset rights. For nonfiction, connect each on-screen claim to its source before rendering.

Reusable prompt

```
Compare one browser and one encoded output for this scene. State the exact dependencies and
inputs, then give me frame samples and checks for timing, text legibility and assets.
```
