

THE V2 BUILD

Build Your JARVIS OS

2.0

one prompt installs it. it runs your whole day →

NOW ROUTED BY JEV

CLAUDE CODE + CODEX
The engine

OBSIDIAN
The memory

LOCAL VOICE
Ears + mouth

NEW

JEV
The classifier

TWO DASHBOARDS
The face

jev picks the tier →

```
> speak  
> route  
> remember
```

```
> RUNS YOUR WHOLE DAY_
```

What Jev Actually Does

IT DOESN'T TALK.
IT DECIDES.

A new "System One" model from TypeSafe.

It doesn't write text. It picks one answer from a fixed list.

Here it's the **classifier**: every voice request goes to Tier 1, 2 or 3.

Routing drops from ~5 seconds to under one.

\$0.042 per million input tokens. Output is free.

WITHOUT JEV

your main model routes • ~5 s

WITH JEV

the classifier routes • under 1 s

TypeSafe's numbers: up to ~200x faster and ~400x cheaper than an LLM at classification.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.

How It Works

THE ADVANTAGE

- ✓ Same buttons in both apps
- ✓ Same voice in both apps
- ✓ No database
- ✓ Just markdown

1. You: talk or click, in Obsidian or the HUD.

2. Jev: classifies the request and routes it to the right tier.

3. Your agent: Claude Code or Codex does the work and saves it to the vault.

Show up with answers. Not open tabs.

You ask or click. The bridge coordinates, your agent does the work, and both dashboards read the results from your vault.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.

The 5 Parts You Need

FIVE PARTS.
ONE SYSTEM.
THAT'S IT.

Part	What It Does
 Claude Code / Codex	 The engine. Does the real work. Switch anytime.
 Obsidian vault	 The memory. Every report lands as markdown.
 Whisper + Kokoro	 The ears + mouth. Your audio stays on your machine.
 Jev	 The classifier. Sorts each request into the right tier.
 Cockpit + HUD	 The face. Two views of the same system.

NEW

Focus on wiring.
Not busywork.

DO THIS NOW.
IT COMPOUNDS.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.

Step 1: Wire the Brain

SKILLS ARE
THE BRAIN CELLS.

PICK UP TO TEN.
BOTH APPS UPDATE.

What it is:

Claude Code or Codex + a folder of skills
each skill = one SKILL.md
every dashboard button runs one

Your starter buttons:

Plan Today — your top 3 + schedule
Inbox Brief — email, triaged
Intel Brief — today's AI news
Deep Research — a report in your vault
Weekly Review — your week, scored

The rule:

every button points to
a real, reviewed SKILL.md

Your buttons live in both apps.
Pick them in Customize dashboard.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.

Step 2: Build the Memory

*If it's not in
the vault,
it didn't happen.*

vault/
inbox/ — everything captured
projects/ — work in progress
content/ — what you shipped
wiki/ — what you learned

1

Every report lands as
markdown. No database.

2

Daily notes hold your plan,
schedule and top 3.

3

`/harvest` turns a finished
project into a wiki article.

4

Both dashboards read
the same files.

Notes, reports and conversations link into one graph. Your agent reads it, and so can you.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.

Step 3: Add the Voice

Your audio
never leaves
the machine.

The orb shows every state: listening, working, speaking.

TIER 1	TIER 2	TIER 3
Rules + saved data. Instant.	Small fast model.	Real work.
"What are my priorities?"	"Summarize today's AI news."	Opens a Claude Code or Codex terminal.

Press Ctrl+Alt+J from any app

Speak, then pause. Local
Whisper transcribes.

Kokoro answers out loud.

MEET JEV

It doesn't write answers.
It picks the tier.
Without it: ~5 seconds
per route.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.

Step 4: Install the Face

ONE PROMPT.
TWO DASHBOARDS.

Open Claude Code or Codex. Paste this:

Clone the Agentic OS V2 repo into ~/agentic-os
and set it up for me.

It installs what's missing.

Pick your buttons.

Something breaks? "Run the doctor."

The Obsidian cockpit: usage, metrics, one-click workflows and today's plan, all read from your vault.

MINDSET: SPEAK. ROUTE. REMEMBER. REPEAT.
