HyperFrames and brag: from a project brief to a rendered launch video

Renderer and workflow layer

The HyperFrames reel introduces the rendering tool; the brag reel demonstrates an opinionated launch-video workflow built on it. They belong together because brag is an application layer rather than a replacement renderer. Begin with the official HyperFrames repository (https://github.com/heygen-com/hyperframes), then inspect brag (https://github.com/latent-spaces/brag) for its current prerequisites and generated assets.

Setup path

The preserved source research documents Node.js and FFmpeg prerequisites. Check the current official README for minimum versions. Verify the installed tools before adding the plugin:

```
node --version
ffmpeg -version
claude plugin marketplace add heygen-com/hyperframes
claude plugin install hyperframes@hyperframes
```

The skills directory (https://github.com/heygen-com/hyperframes/tree/main/skills) explains available workflows. For a skills-compatible agent, the alternative path documented in the original guide is `npx skills add heygen-com/hyperframes`; inspect the current CLI prompt and selected target. Installation commands are documented instructions and were not run for this research.

Render something small

Start with a ten-second composition using your own text, logos and screenshots. Preview it, render locally, inspect the resulting MP4 for fonts, timing, clipping and audio levels, then repeat at the intended output resolution. Only after that should you let a launch-video skill derive scenes from a larger project.

```
Using /hyperframes, create a ten-second launch video for my project using
the supplied original assets. Show the scene plan first, avoid invented
product claims, render locally, and report the output path and actual
validation results. Ask before invoking paid voice, avatars or cloud rendering.
```

Costs and rights

Separate the open-source renderer from optional hosted HeyGen features. A "free local render" claim does not make generated voice, avatar services, a coding-agent subscription or every bundled workflow free. Recheck the current plan and cloud documentation (https://hyperframes.heygen.com/deploy/cloud.md) before choosing those paths. Code licensing does not automatically license a font, music track or uploaded logo. The original guide's version and star counts are September observations.

A realistic project

Build a launch-video brief tool: ingest a project's own README and approved screenshots, produce a scene manifest, allow human edits, then render through HyperFrames. Include asset provenance and accessibility captions. Test missing fonts, long titles, absent FFmpeg and render failures. Deliver one reproducible example; do not imply a proposed brief has already produced a video.

The two source links and original PDFs remain available, including the more detailed installation and cloud caveats. This guide gives the common sequence and the role of each tool.
