Obsidian as shared AI memory: a source-backed wiki and handoffs

A single durable workspace

The first source proposes one Obsidian vault across assistants; the second adds a wiki that evolves as sources accumulate. The useful common idea is durable files with provenance. A saved conversation is not automatically reliable memory, and a path in a prompt does not grant access to local files.

Karpathy's LLM Wiki idea (https://gist.github.com/karpathy/442a6bf555914893e9891c11519de94f) provides the raw/compiled/rules pattern. Adapt it into `raw/`, `wiki/`, `projects/` and an entry `index.md`. Treat raw evidence as immutable. A compiled page should cite source files, distinguish observations from proposals and record unresolved contradictions.

Setup and bridging

Install through Obsidian's official download page (https://obsidian.md/download). The CLI guide (https://obsidian.md/help/cli) covers registration, installer requirements and the running-app dependency. After enabling the command line interface and reopening the terminal:

```
obsidian help
obsidian vault="Research" search query="project handoff"
```

`Research` is an example vault name. These are documented syntax adaptations, not evidence that a vault has been created. An assistant may use scoped filesystem tools, an authenticated connector, or an attached snapshot. Check each bridge's actual capabilities and refresh behavior.

Maintain and hand off

Give each project `status.md`, `decisions.md`, `open-questions.md` and dated session notes. Before work, read current status and relevant evidence. After work, record verified state, changed files, last successful check, blockers and the next action. Link conclusions to evidence rather than retaining every conversational turn in the main context.

Use one writer at a time and review diffs. Keep recoverable version history and test restoration. Updates should revise the compiled page while preserving the raw account; disagreement belongs in an explicit note. Avoid putting credentials or unnecessary personal details in either layer.

A useful project

Build a handoff benchmark: assistant A completes a small fixture task and saves the agreed template. Assistant B receives only the permitted vault files and continues it. Score omitted constraints, stale facts, repeated explanation and incorrect claims of completed work. Repeat after a changed decision, denied file permission and contradictory source.

```
Create a source-backed project wiki and handoff template. Keep immutable raw
notes, editable compiled pages and explicit operating rules. Connect one
assistant at a time with scoped access. Test a second assistant using only
saved context and score fidelity. Deliver sample notes, revision/recovery
instructions and a small evidence-based report.
```

The Jarvis voice-agent guide is related but covers orchestration and channels rather than this file contract. Both source dossiers, transcripts and PDFs remain available here.
