AI career preparation: a 60-day sprint inside a realistic job search

Researched 2026-11-02.

What the reel supplies, and what is missing

The reel advertises a 60-day plan for AI product manager, forward-deployed engineer and AI engineer roles, plus a gated resume/prompt/automation bundle. The complete bundle was not obtained. Creator offer counts and job-timeline claims were not independently established. January 1, 2027 is a self-imposed target in the reel, not an employer application deadline. This independent plan was researched November 2, 2026.

The useful distinction is between preparing evidence of ability and running a job-search funnel. A 60-day learning sprint can fit inside the existing 90-day application routine; neither guarantees an offer. The public library therefore combines these two reels into one career-system topic while keeping both original links and source evidence.

Choose one track

Track	Demonstrable task	Portfolio evidence
AI product manager	Define a narrow user problem and evaluate an AI feature	Product brief, user task, evaluation rubric, cost and failure decisions
Forward-deployed engineer	Integrate a useful workflow into a realistic customer environment	Working API/data integration, deployment notes and an explanation to a non-specialist
AI engineer	Build and evaluate an inference or retrieval application	Reproducible code, test set, quality/cost/latency report and failure analysis

Titles vary by employer. Read several real postings before choosing a plan; do not learn three complete tracks simultaneously because a reel lists them together.

Independent learning resources

The Hugging Face LLM course (https://huggingface.co/learn/llm-course/chapter1/1) offers a structured route through model tooling. Microsoft's Generative AI for Beginners (https://github.com/microsoft/generative-ai-for-beginners) provides practical lessons and examples; check each lesson's prerequisites and service costs. Full Stack Deep Learning's LLM Bootcamp (https://fullstackdeeplearning.com/llm-bootcamp/) is a 2023 course with useful systems framing, not a claim that every old API example remains current. These are independently selected public alternatives, not the creator's hidden syllabus or certification recommendations.

A bounded 60-day preparation sprint

Days 1-7: choose the role, read representative postings and identify a small project with explicit success criteria. Days 8-21: learn only the foundations needed for that project and reproduce a small example. Days 22-42: build a complete vertical workflow and record quality, latency, cost and failure cases. Days 43-53: improve the weakest result and write a concise case study. Days 54-60: practice explaining tradeoffs, review the resume against evidence and choose the next application cohort. Keep applications and interview practice running when relevant roles are available rather than waiting for the sprint to end.

Reusable prompt

```
Help me choose one AI role track from these real postings and my actual
experience. Design a 60-day preparation sprint around one demonstrable
project, with weekly deliverables and a small evaluation set. Distinguish
learning tasks from applications and interview practice. Use free public
resources when suitable, state service costs and gaps, and never fabricate
experience, metrics, a certification requirement or a guaranteed offer.
```

Project idea and next step

Extend a private job-search tracker with a requirements-to-evidence matrix and weekly practice outcomes. A portfolio item should connect a real requirement to code or a documented decision, rather than count course completions. Start by choosing one role track and collecting a few representative employer postings. No job automation skill was installed and no outreach was sent.
