Claude dynamic workflows: scope execution and measure the handoffs

Researched 2026-11-07.

Strengths and best use

Dynamic workflows let Claude Code write orchestration scripts and coordinate parallel work for large audits and migrations. The strength is decomposing independent work and consolidating verified results. Anthropic's current article describes general availability and warns about substantial token use. Official article (https://claude.com/resources/articles/introducing-dynamic-workflows-in-claude-code)

Current checks

The current article lists CLI, Desktop, and VS Code support across several paid plans and API platforms. It describes asking for a workflow directly, or selecting `ultracode` through the effort menu. These details supersede the reel's release-era framing. Product availability and the separate Projects interface should be checked in the actual account. Workflow documentation (https://code.claude.com/docs/en/workflows)

Evaluate one bounded workflow

1. Choose a task with a measurable outcome, such as finding and reproducing one category of error across a service.
2. Define ownership boundaries, shared files, dependencies, and the final integration check.
3. Start with two independent work units and a fixed cost and time budget.
4. Separate findings from reproduced bugs. Have the coordinator integrate the evidence and run the normal entry-point checks.
5. Compare completed acceptance criteria, wall time, usage, and rework with a single-session baseline.

Reusable prompt

```
Design a dynamic workflow for this bounded task. Identify independent work, shared files, and ordering constraints. State a cost ceiling and integration checks. Preserve findings with file references and reproduction evidence. Report completed acceptance criteria and actual usage at the end.
```

Project idea

Create an orchestration scorecard with baseline effort, work units, conflicts, reproduced findings, cost, and final acceptance. Run the comparison on a disposable fixture repository.
