A modular content stack: visual editing, costs and reviewed distribution

Researched 2026-11-07.

Strengths and best use

The stack combines specialized components into a repeatable content pipeline. video-use offers timestamped transcripts and visual composites for edit decisions. Editly exposes declarative editing, and HyperFrames supplies authored graphics. This division makes components replaceable and measurable. video-use (https://github.com/browser-use/video-use) - Editly (https://github.com/mifi/editly) - HyperFrames (https://github.com/heygen-com/hyperframes)

Current checks

video-use's README describes ElevenLabs Scribe transcription plus on-demand visual composites. It therefore has an external transcription dependency. Remotion's free license covers eligible individuals and small teams, with separate company conditions. The reel's monthly total needs an itemized bill that includes usage, stock or generated footage, and optional publishing services. Remotion license (https://www.remotion.dev/docs/license/faq) - Claude plans (https://claude.com/pricing)

Test a small pipeline

Start with one owned recording, one short output, and manual publication. Record transcription cost, model usage, media generation, rendering, and review time. Keep drafts versioned and require a reviewed export before connecting a distribution step. If using Apify or Resend, inspect the actual task and email volume against their current plans. Apify pricing (https://apify.com/pricing) - Resend pricing (https://resend.com/pricing)

For a disposable video-use checkout, its README documents dependency installation. Configure its required services using the linked installation guide.

```
git clone https://github.com/browser-use/video-use.git
cd video-use
uv sync
```

Reusable prompt

```
Design this content pipeline as replaceable stages. For each stage record input, output,
provider, expected cost, failure behavior, and manual review. Produce one short draft using
owned media and an itemized cost worksheet before extending the pipeline.
```

Project idea

Create a production cost dashboard from mock jobs, including retries, unsuccessful exports, review time, and accepted deliverables.
